The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growt or viability of an organism. Polynucleotide sequences AAH51947 - AAH57 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention.

The smallest plasmid obtained which conferred resistance
the target of action for isoniazid, was designated pS5.
sequence of pS5 was determined (AAQ78915), revealing 2 la
reading frames, the InhA gene comprising ORF2.

The smallest plasmid obtained which conferred an isoniazid resistance phenotype on M. smegmatis was designated pS5 Sequencing of pS5 revealed 2 open reading frames, ORF2 corresponding to the inhA gene. Mutants of this gene have been moved in the inhA
                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotide(s) determining mycobacterial isonlazid - useful in diagnosis, treatment mycobacterial infection, e.g. tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microorganisms e.g. algae, archaea, bacteria, fungi and parasites, for universal detection and for specific and ubiquitous detection and identification of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group. A nucleic acid (I) obtained using the method of the invention can be used for the universal detection of any bacterium fungus or parasite in a semila and for the
                                                      1975
                                                                               1190
                                                                                                                                                                 1855
                                                                                                                                                                                           1070
                                                                                                                                                                                                                                                                                                              Corynebacterium sp., Enterobacteriaceae group, Escherichia coli, Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., Neisseria gonorrhoeae and Staphylococcus sp. Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                      detection of any bacterium, fungus or parasite in a sample and for the detection of at least one antimicrobial agent resistance gene or at least one toxin gene. hexa nucleic acids are used for the specific and ubiquitous detection and for identification of Streptococcus pneumoniae. (I) can be used to design a therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group which can be detected include Abiotrophia addacens, Bordetella sp.,

                                                                                                                                                                                                                                                                                           Genes from Mycobacterium smegmatis, Mycobacterium tuberculosis Mycobacterium bovis that encode inha, the target of action for isoniazid, were identified, isolated and cloned. Sequences of the 3 genes are given in AAQ78913-15, and encoded amino acids isolated. AAR66289-91. Mutant genes have been used in recombinant vaccing the sequences of the sequences of the sequences.
                                                                                                                                                                                                                                                                                                                                                                        Gene target for isonicotinic acid hydrazide - used to prods for diagnosis, treatment, prevention and studies mycobacterial infections

                                                                                                                                         antibiotics, as decoys and as antisense oligonucleotides to prevent the expression of polypeptides associated with isoniazid (also referred to isonicotinic acid hydrazide) resistance, and for the expression of the proteins, which may also have use in immunoassays for the detection of INH resistant strains, in the determination of whether an INH type antibiotic may be effective against tuberculosis, and in the treatment individuals for infection with these strains.
                                                                                                                                                                                                                                           This sequence represents the coding sequence for a mycobacterial Inha protein. The encoded protein is involved in mycolic acid biosynthesis. The nucleic acids are useful in assessing the susceptibility of various strains of the M. tuberculosis complex to isoniazid (INH) type

The present invention describes: (1) a crystallised InhA enzyme in the form of a plate having the space group C2 and the unit cell constants a = 101.1 Angstrom , b = 83.4 Angstrom , c = 192.9 Angstrom , beta = 95 deg. and alpha = gamma = 90 deg.; (2) a crystallised InhA enzyme in the form of a parallelpiped having the space group P21 and the unit cell constants a = 69.0 Angstrom , b = 116.0 Angstrom , c = 65.0 Angstrom , b = 116.0 Angstrom , c = 65.0 Angstrom of a parallelpiped having the space group P6222 and the unit cell constants a = 90 deg.; (3) a crystallised InhA enzyme in the form of a hexagon having the space group P6222 and the unit cell constants a = 120 deg. A knowledge of the crystal structure of InhA (which is the target of isonazid in Mycobacterium tuberculosum) will help in
                                                                                                                                                                                                                                                                          1101

                                                                                                                                                                                                                                                                                                                                                                                                          1070
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the Mycobacterium tuberculosis inhA coding sequence. The invention relates to a method for identifying inhibitors InhA enzyme comprises identifying compounds which fit the catalytic active site of the crystallized enzyme. Inhibitors of the activity of t InhA enzyme can be used for treating Mycobacteria tuberculosis infectic

                                                 A gene encoding a cellulose synthetic in the amount of cellulose synthesised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1161
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     compounds which inhibit InhA-mediated enoyl reductase activity. Compounds which inhibit the activity of InhA enzyme inhibit its ability to produce mycolic acids which are essential for cell survival. Such compounds can be used to treat bacterial infection, particularly mycobacterial infection such as Mycobacterium tuberculosis infection. In addition such compounds can be used as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cellulose synthase;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a gene encoding a subunit of the cellulose synthase complex of Vigna angularis. The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 10732 BP; 3149 A; 1212 C; 2074 G;

The encoded protein is involved in mycolic acid biosynthesis. The nucleic acids are useful in assessing the susceptibility of various strains of the M. tuberculosis complex to isoniazid (INH) type antibiotics, as decoys and as antisense oligonucleotides to prevent the expression of polypeptides associated with isoniazid (also referred to a isonicotinic acid hydrazide) resistance, and for the expression of the proteins, which may also have use in immunoassays for the detection of INH resistant strains, in the determination of whether an INH type antibiotic may be effective against tuberculosis, and in the treatment clindividuals for infection with these strains.

The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty acids. They may be reacted with an apo-carrier protein and coenzyme A to produce a holo-carrier protein. The BLM gene cluster or catalytic domains can be used individually or collectively to produce thiazoline, thiazoline, bithiazoline and bithiazoline-containing microbial metabolites. The BLM gene cluster may also be used to produce
